# Smp Cache 2.0 (Updated 2022)

The cache module has been implemented with Java and is available under the GPL license. SMPCache is written in the java programming language. It includes also a GUI interface written in the Java Swing library and the simulation modules in the Java language. The whole system was developed using GNU Ant and JUnit. It can be downloaded from . [^1]: [^2]: the code was developed on a MacBook Pro 15", Mac OS X 10.10.4 [^3]: it is worthwhile to stress that in order to calculate the correct complexity, C is not normalized, e.g. a problem whose size is $n_1 \cdot n_2$ is still a problem of size n_1+n_2; therefore, the $C(n_1 \cdot n_2)$ and $C(n_1 \cdot n_2 + n_1+n_2)$ are the same in the normalized value [^4]: The problem size has not been normalized. [^5]: In order to consider different situations and a fair comparison, the size of the cache has been chosen in order to give the same cache size for each problem size. [^6]: In fact, in the conditions of the experiment we are considering the problem size does not take into account the main and the subword sizes; so the main and subword cache sizes are the same. [^7]: this is a simplification, since this problem can be calculated in $O(n)$, so the difference is negligible. , within 40 km of the city centre. Transport Rail The city has one of the largest networks of Metros in India, the major one being Chennai Metro which connects with the rest of Chennai by the metros, the suburban Chennai Metro trains and the local trains. The suburban trains of Chennai are of two types, Chennai Suburban Railways and Chennai MRTS. The city is also connected by the national network of Indian Railways. Local The city is connected with other parts of Tamil Nadu, with a dense and well connected local rail network, which is served by suburban and long distance
